Name: Pratik Deep Girkar
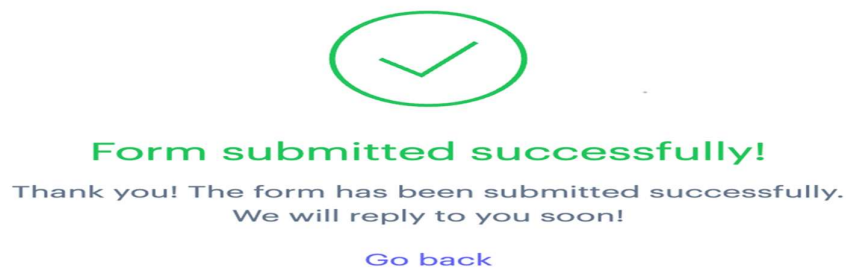

Roll No.: 38

Branch: TE_IT (A)

Batch: A-2

Feedback And Constraint

- **Example:** When you press a key on your smartphone keyboard, it briefly changes color or makes a click sound.
  Reason: This feedback confirms to the user that the keypress was registered. Without this, the user might keep pressing keys unsure if the phone registered their input.
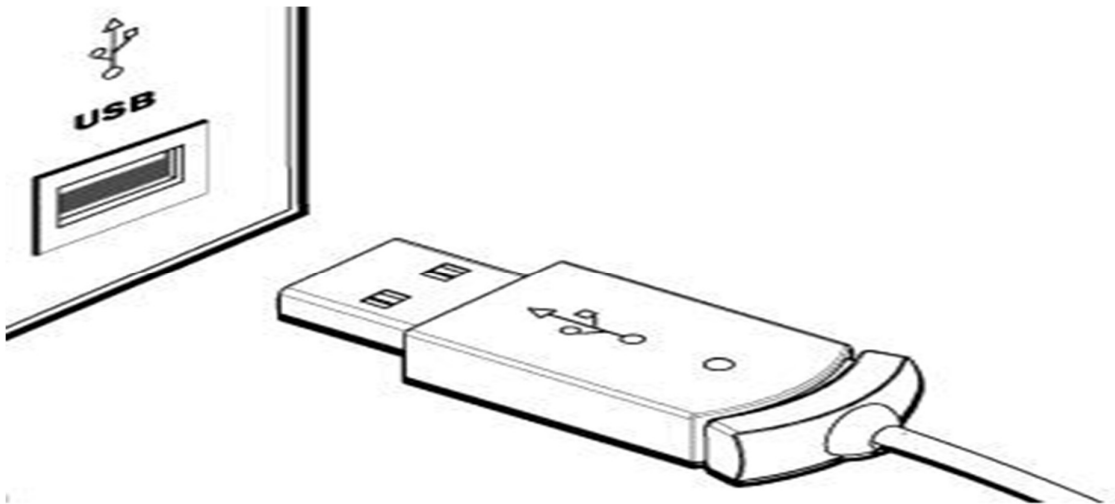

- **Example:** After submitting an online form, you get a message like "Form submitted successfully!"
  Reason: This feedback reassures users their action was completed correctly. It prevents confusion about whether the form submission worked or if they need to try again.

Form submitted successfully!
Thank you! The form has been submitted successfully.
We will reply to you soon!

Go back

- **Example:** A loading spinner appears after clicking a download button on a website.
  Reason: It shows the system is working on the request and prevents users from thinking the system is frozen or unresponsive.

L O A D I N G . . .

- **Example:** A USB connector can only be plugged in one way.
  Reason: This **physical constraint** prevents users from damaging the port or connector by inserting it incorrectly, guiding correct usage naturally.

- **Example:** On a registration form, the email field won't accept input without an "@" symbol.
  Reason: This **logical constraint** helps prevent user errors by only allowing valid email formats, which avoids issues in data submission and processing.
